Heat transfer processes are classified into three types. The first is conduction, which is defined as transfer of heat occurring through intervening matter without bulk motion of the matter. Figure 1.1 shows the process pictorially. A solid (a block of metal, say) has one surface at a high temperature and one at a lower temperature.

A variety of high-intensity heat transfer processes are involved with combustion and chemical reaction in the gasifier unit itself. The gas goes through various cleanup and pipe-delivery processes to get to our stoves. The heat transfer processes involved in these stages are generally less intense.

Abstract. This chapter deals with three different types of heat transfer: conduction, convection, and radiation heat transfer. Relevant dimensionless numbers such as Nusselt number, Prandtl number, and Grashof number are shown to help systematically understand the heat transfer.

Heat transfer is a discipline of thermal engineering that concerns the generation, use, conversion, and exchange of thermal energy between physical systems. Heat transfer is classified into various mechanisms, such as thermal conduction, thermal convection, thermal radiation, and transfer of energy by phase changes. Engineers also consider the transfer of mass of differing chemical species, either cold or hot, to achieve heat

transfer.
