A hydraulic model is a computerized, or digital, representation of a hydraulic, or fluid, system. In this case, it is a pressured closed pipe potable water supply system. The modeling software predicts hydraulic properties throughout the system: flow, pressure,

In the seventies digital computers became available and were used to model and simulate hydraulic systems. In the beginning only small models with few states were used because no simulation software was available. For each modeling task a new program had to be written in a programming language, e. g. ALGOL or FORTRAN.

A hydraulic percussive drilling system is composed of percussion, rotation, feed, and flushing functions. In this paper, we detail the interaction of feed and rotation functions using a rock model. The feed actuator is a cylinder drive and a hydraulic motor actuator rotates the drill bit.

To observe the dynamic behaviours of CANDU-SCWR, the detailed CANDU-SCWR thermal-hydraulic model is developed. The movable boundary method is adopted for CANDU-SCWR thermal-hydraulic modeling. The benefits of adopting movable boundary are derived from the comparisons with the fixed boundary method.
