Non-linear least squares is the form of least squares analysis used to fit a set of  $m$  observations with a model that is non-linear in  $n$  unknown parameters ( $m > n$ ). It is used in some forms of nonlinear regression. The basis of the method is to approximate the model by a linear one and to refine the parameters by successive iterations.

In a different usage to the above definition, a polynomial of degree 1 is said to be linear, because the graph of a function of that form is a line. Over the reals, a linear equation is one of the forms:  $y = mx + b$  where  $m$  is often called the slope or gradient;  $b$  the y-intercept, which gives the point of intersection between the graph of the function and the y-axis.

I would like to know if there is a package in R handling non linear integer optimization. "Basically", I would like to solve the following problem:  $\max f(x)$  s.t  $x$  in  $(0,10)$  and  $x$  is integer. I k...
