Rather present practice of formulating acceptance criteria is based on the acceptance of the actually observed occurrence rates of the different categories of adverse events. Different types of consequence preference ordering in decision modeling are discussed for clarification before the key result is derived.

The new modeling parameters and acceptance criteria were largely based on model tests on rectangular rocking foundations with a limited range of footing length to width ratio (L/B). New model test results are presented, including a systematic variation of L/B and also non-rectangular (I-shaped) footings.
